

SPATULA

PRESENTATION

WHAT SHOULD I COOK?

- Deciding what to cook can feel harder than cooking itself.
- Ingredients get overlooked when we don’t know how to use them.
- Searching through recipes takes time and may require more groceries.
- We want an easier way to find meal ideas using what’s already available.

“I have chicken and rice… but what can I make?”

OUR RECIPE FINDER

BY INGREDIENT

Discover meal ideas using ingredients you already have.

BY DISH NAME

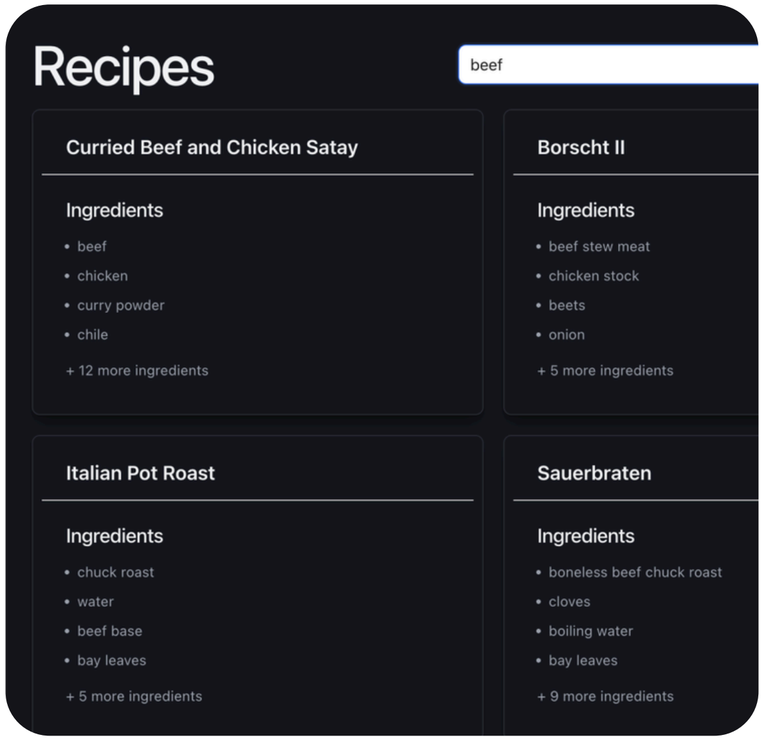

Find a specific dish and view its ingredients and instructions.

SPATULA IN ACTION

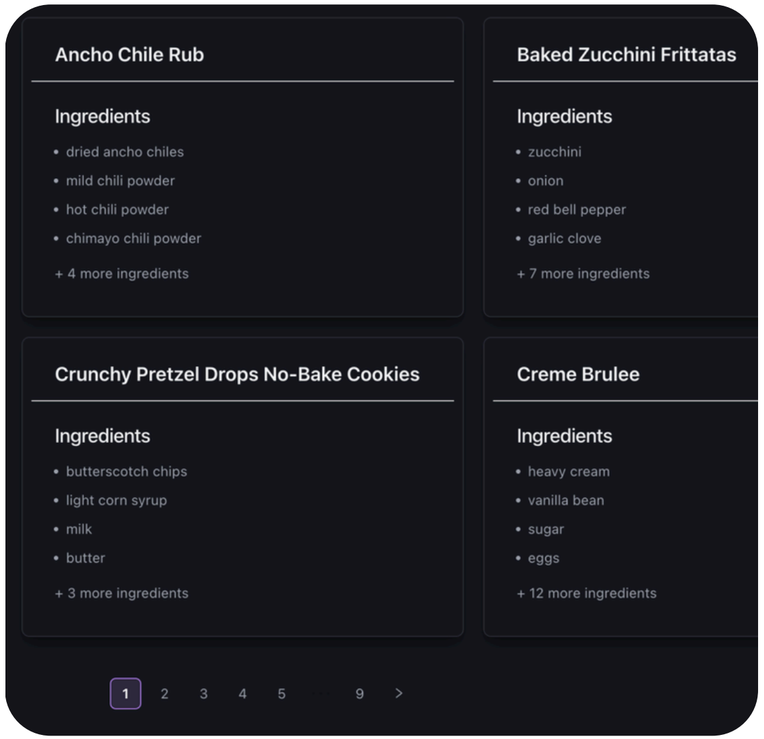

Find a recipe in three simple steps.

Recipe Details
View ingredients and cooking instructions.

Keyword Search
Find recipes by ingredient or dish name.

Browse Recipes
Explore meal ideas without entering a search.

DATABASE DESIGN

- Database: MySQL
- Data source: Food.com recipes via Kaggle
- Structure: One recipes table
- Records: One row per recipe
- Primary key: Unique recipe ID
- Text fields: Ingredients, steps, and tags stored as lists

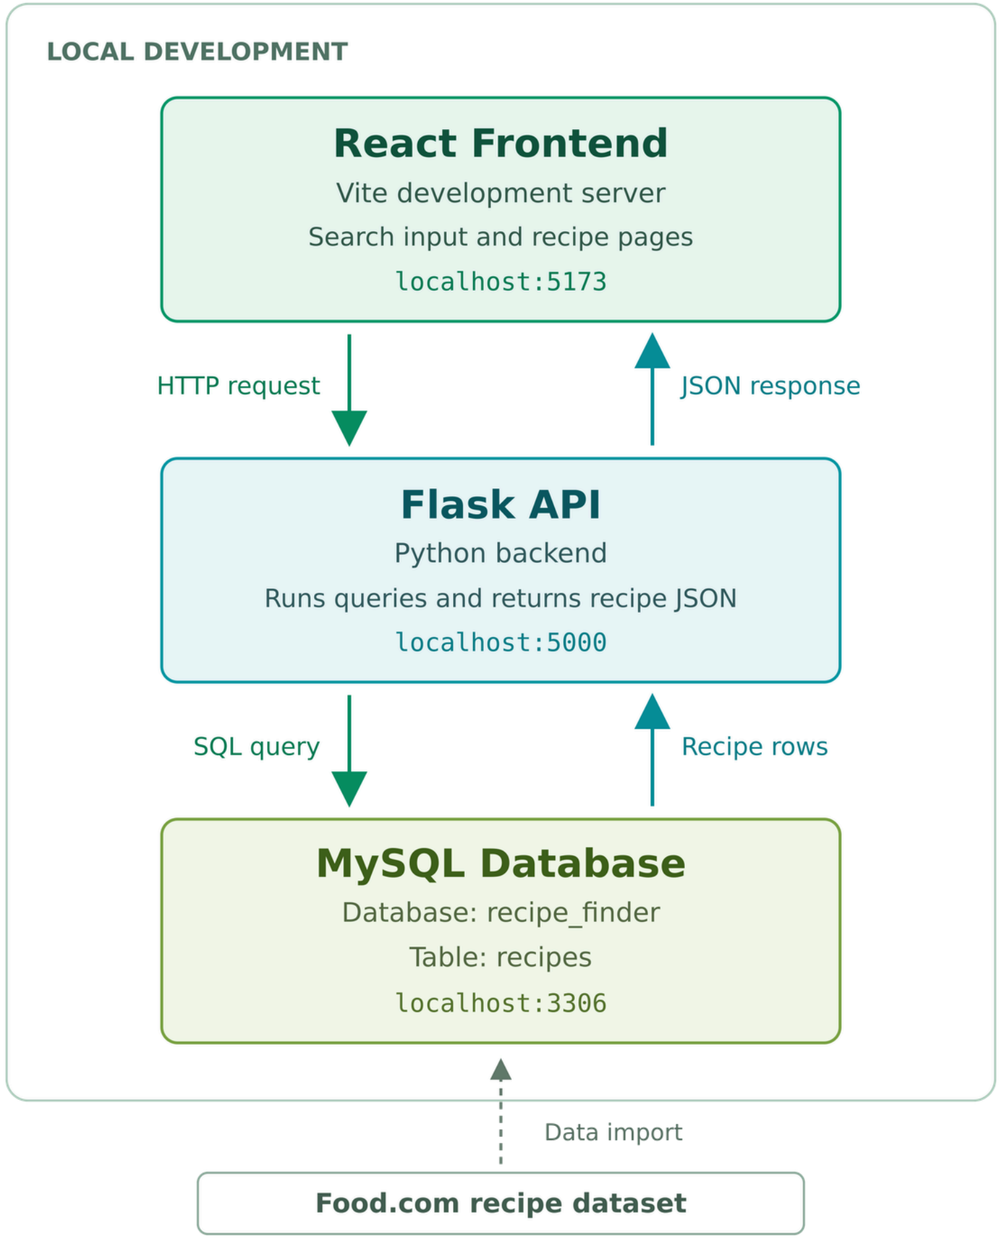

recipes

recipe_finder

COLUMN	TYPE	KEY
id	INT	**PK**
name	VARCHAR(255)	
description	TEXT	
ingredients	TEXT	
ingredients_raw_str	TEXT	
serving_size	VARCHAR(255)	
servings	INT	
steps	TEXT	
tags	TEXT	
search_terms	TEXT	

PK = Primary key

One row per recipe

BEHIND THE SEARCH

- A user's search travels from the interface to the backend.
- The backend looks for matching recipes in the database.
- Results return to the interface for users to browse.
- Opening a recipe retrieves its full ingredients and instructions.

WORKING NOW

- Browse available recipes before entering a search.
- Search using an ingredient, dish name, or keyword.
- View recipe results with previews of their ingredients.
- Open a recipe to read its description and full ingredient list.
- Follow the recipe’s cooking instructions step by step.
- Move between pages to explore additional recipe results.

NEXT PHASE

- Support searches using multiple ingredients at once.
- Rank recipes by how closely they match ingredients.
- Separate ingredients and tags into related database tables.
- Add user accounts and the ability to save favorite recipes.
- Test searches with varied keywords and recipes.

CONTRIBUTIONS

- Aaron Delgado: Backend Work
- Chau Pham: Frontend
- Itali Pizarro Valentin: Mock/ MVP Site
- William Gray: Backend/ Data
- Andres Ramos: Slide design and presentation preparation
- Drew Ramgiri: Frontend

ROADMAP

- Database: Build tables for user accounts and saved recipes.
- Application: Add account creation and recipe-saving features.
- Testing: Verify functionality and resolve bugs.
- Documentation: Document the database schema and design decisions.
